

The updated ZephIR application has been adapted to work with eyeTV 2.4. The eyeTV application can be configured to work with a satellite or cable box (a set top box).

The recorded video comes from the output of the set top box.

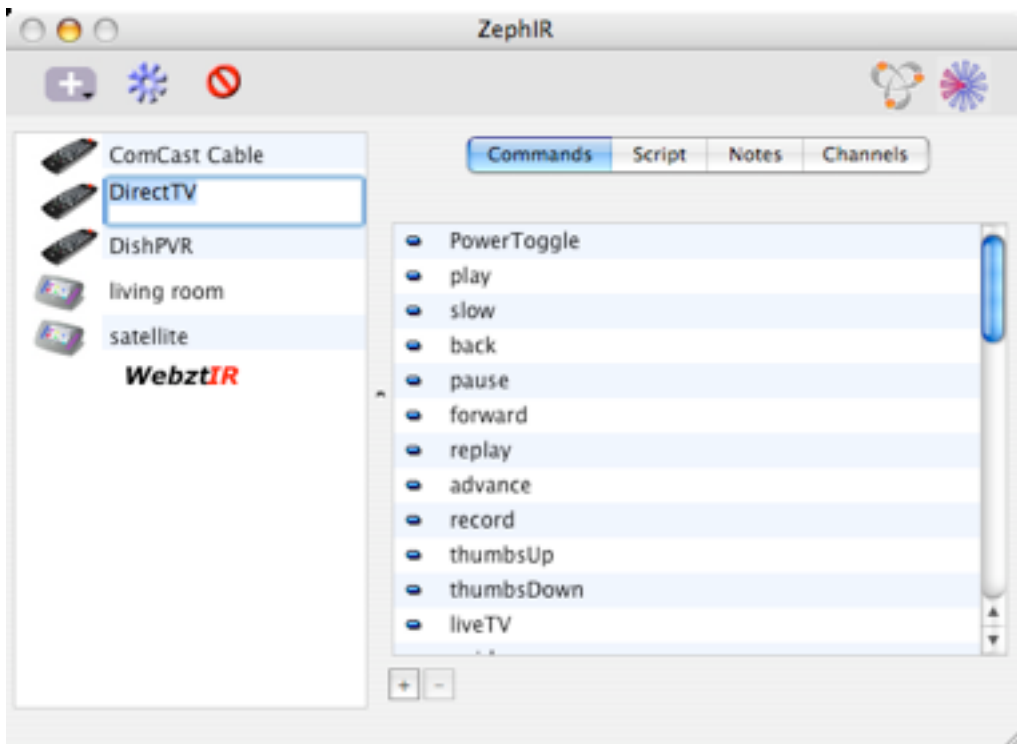

When the channel for eyeTV is changed, a signal is sent to the ZephIR application and the infrared signals are sent which change the set top box.

Both eyeTV and the ZephIR must be configured to work together. The set top box is named in the eyeTV application as part of the initial setup. It is necessary to name the component in the ZephIR the **SAME NAME YOU USE EXACTLY** in configuring eyeTV.

### *eyeTV configuration panel*

### *ZephIR browser panel*

The above two windows show how "DirectTV" is used as the same name in eyeTV and the component in ZephIR.
